

# UNIFORM WEB TENSION

## *CORRECTION WHEREVER YOU NEED IT*

**T**he CGS Tension Control Roll is used anywhere there is uneven tension across the web. The principle is simple: the web is passed over the tension control roll; all loose areas across the web are eliminated.

The benefits are significant, providing even heat transfer across the sheet, increasing splicer reliability (resulting in less down time and startup waste), and reducing twist warp caused by uneven tension.

Plants are using these successfully at the bridge, wrap rolls and the splicer just to name a few of the many locations where tension problems occur!

- Even Heat Transfer Across Sheet
- Increased Splicer Reliability
- Reduces Twist Warp Caused By Uneven Tension
